

XDS - X Data Service

We connect to the prod123k01 server to restart any XDSKD or XDSBacardi or XDSRD instance is down or running in FullGC.

Scripts path: /user/bin/xds.sh

User id: xdsprd and server: prod123k01

Instance Name: XDSKD, XDSBacardi, XDSRD

XDSKD is an XDS instance name. Like that we have many instance. This name will change based on user query.

ssh xdsprd@prod123k01

Restart: —> Stop: /user/bin/xds.sh -s XDSKD stop 3; Status: /user/bin/xds.sh -s XDSKD status Start: /user/bin/xds.sh -s XDSKD start.

Status: /user/bin/xds.sh -s XDSKD status

Config: /user/bin/xds.sh -s XDSKD config

Install: /user/bin/xds.sh -s XDSKD install

Command to check xds is ready: grep -i 'data service is ready' XDS.log

After restart we need to check XDS preloading: grep -i 'data service is ready' XDS.log. If this message is not seen in this XDS.log file then use this command "grep -il 'data service is ready' XDS.log* *" - this file give log file name where 'data service is ready' message is present.

To ping CNS from any server: CobraPingForXDSALLCNS PRD XDSKD —> XDSKD this parameter will change based on instance user need to check.
